# What is a barcode?

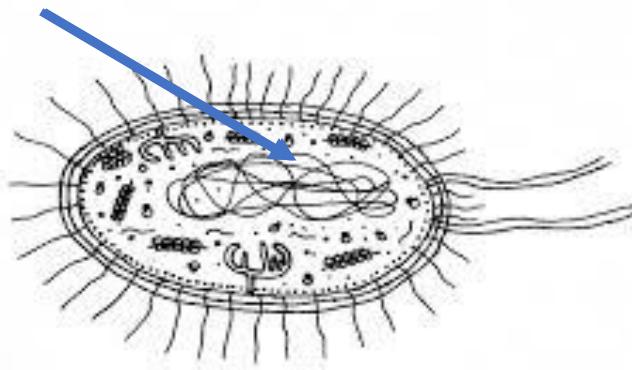

a machine-readable code: in the form of numbers and a pattern of parallel lines to identify a certain item,

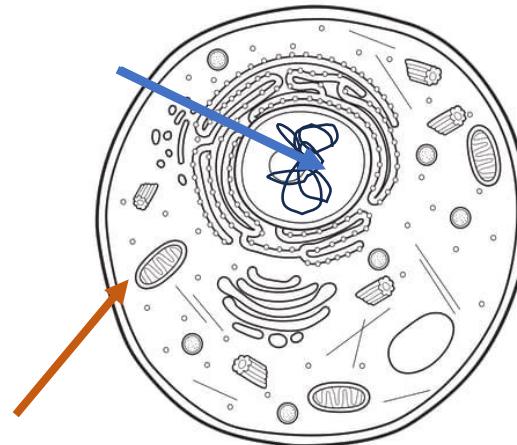

to identify a certain gene/organism

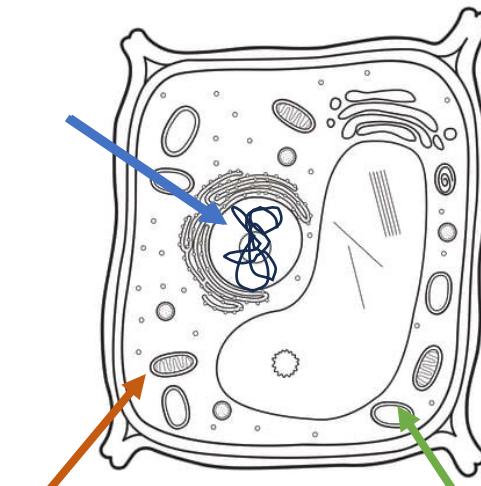

# Barcode

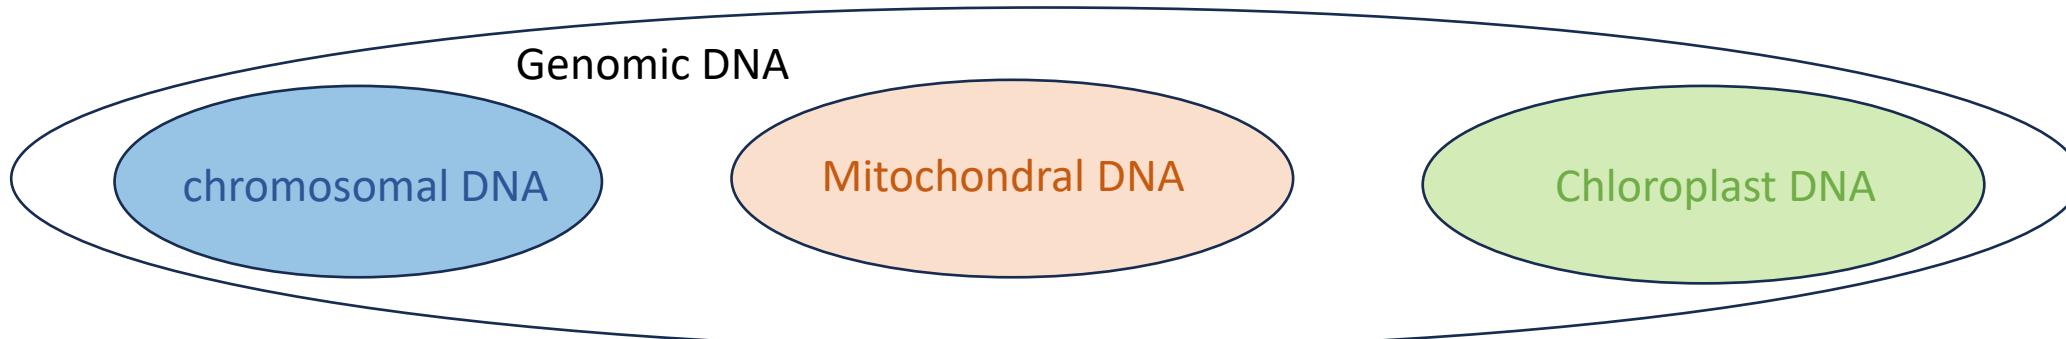

prokaryotic cell

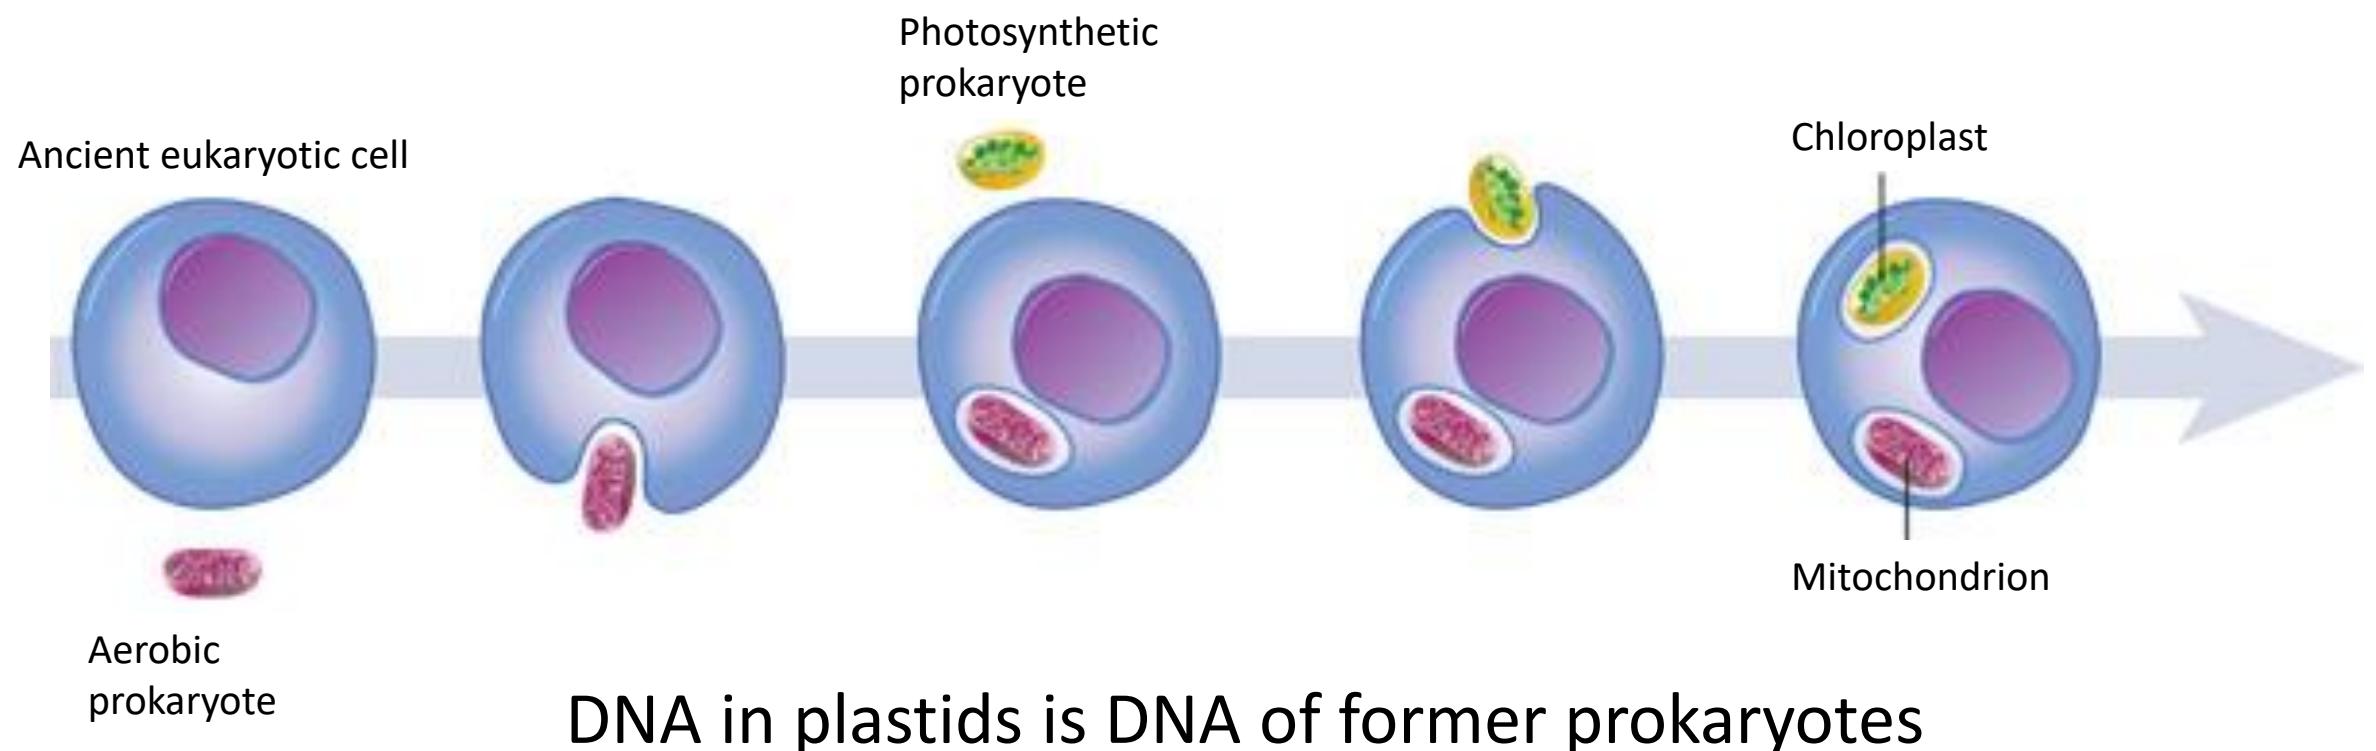

eukarytic cell (animal)

eukarytic cell (plant)

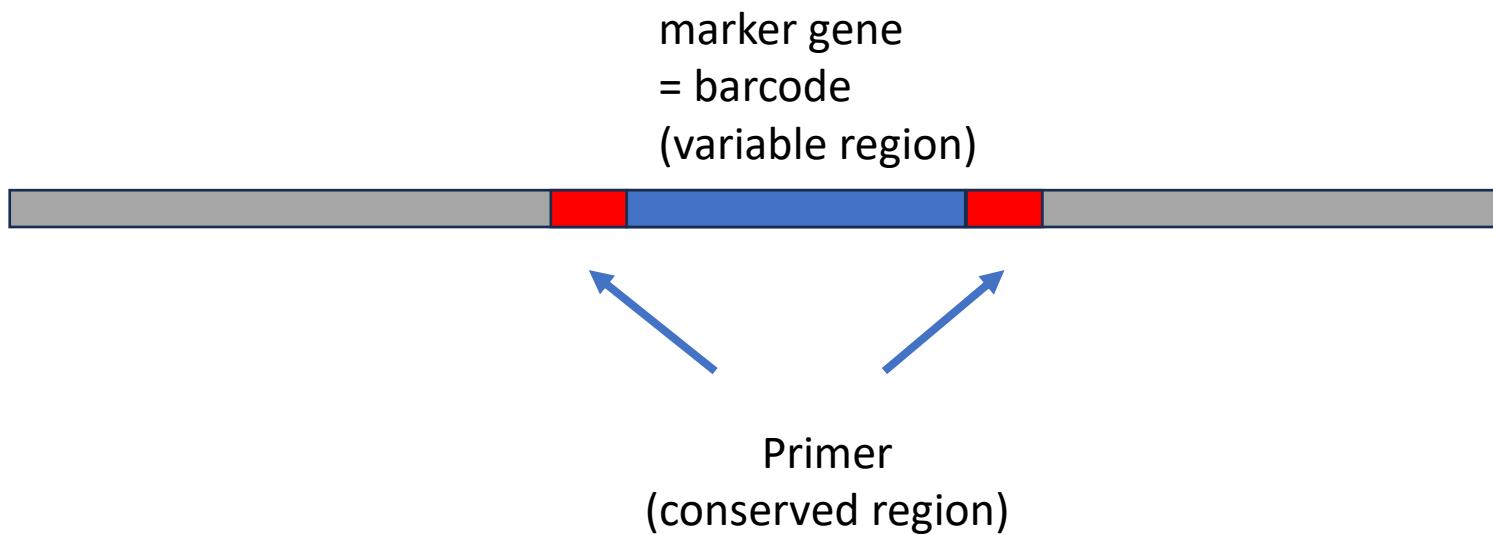

# Barcode

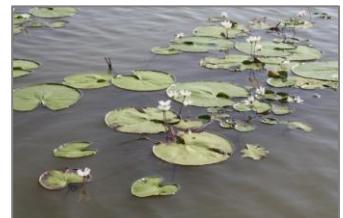

## Barcode

Group of organisms	Marker gene/locus used for barcoding
Animals	COI, <i>Cytb</i> , 12S, 16S
Plants	<i>matK</i> , <i>rbcL</i> , <i>psbA-trnH</i> , ITS
Bacteria	COI, <i>rpoB</i> , 16S, <i>cpn60</i> , <i>tuf</i> , RIF, <i>gnd</i>
Fungi	ITS, TEF1 $\alpha$ , RPB1 (LSU), RPB2 (LSU), 18S (SSU)
Protists	ITS, COI, <i>rbcL</i> , 18S, 28S

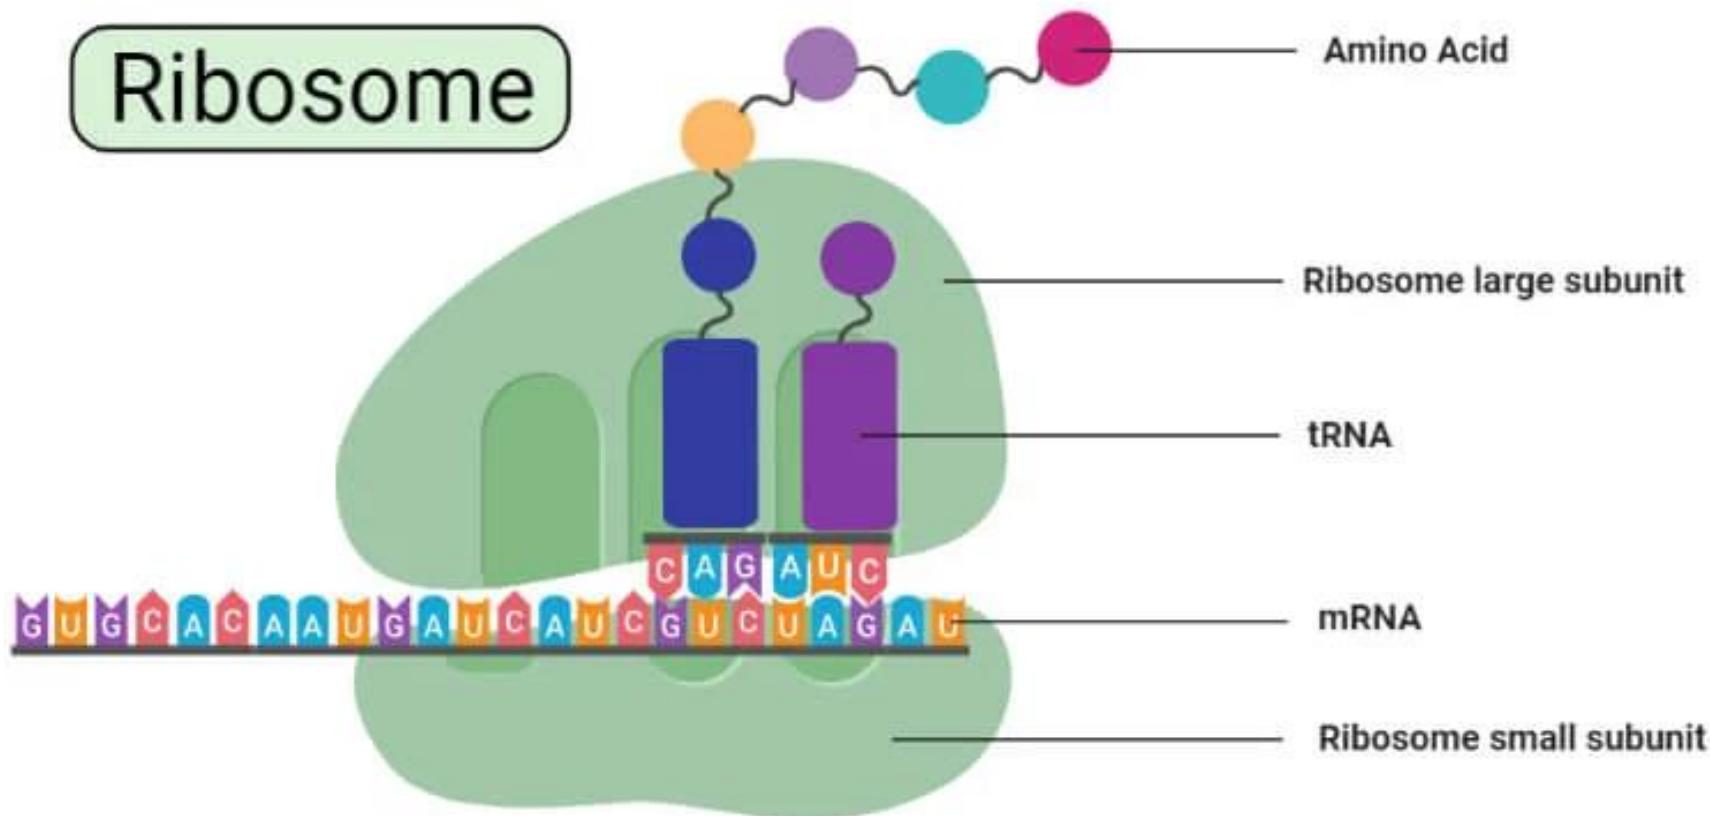

## Barcode selection

- (i) significant interspecific genetic variability
- (ii) conserved flanking sites for developing universal PCR primers
- (iii) rel. short sequence length depending on sequence technology

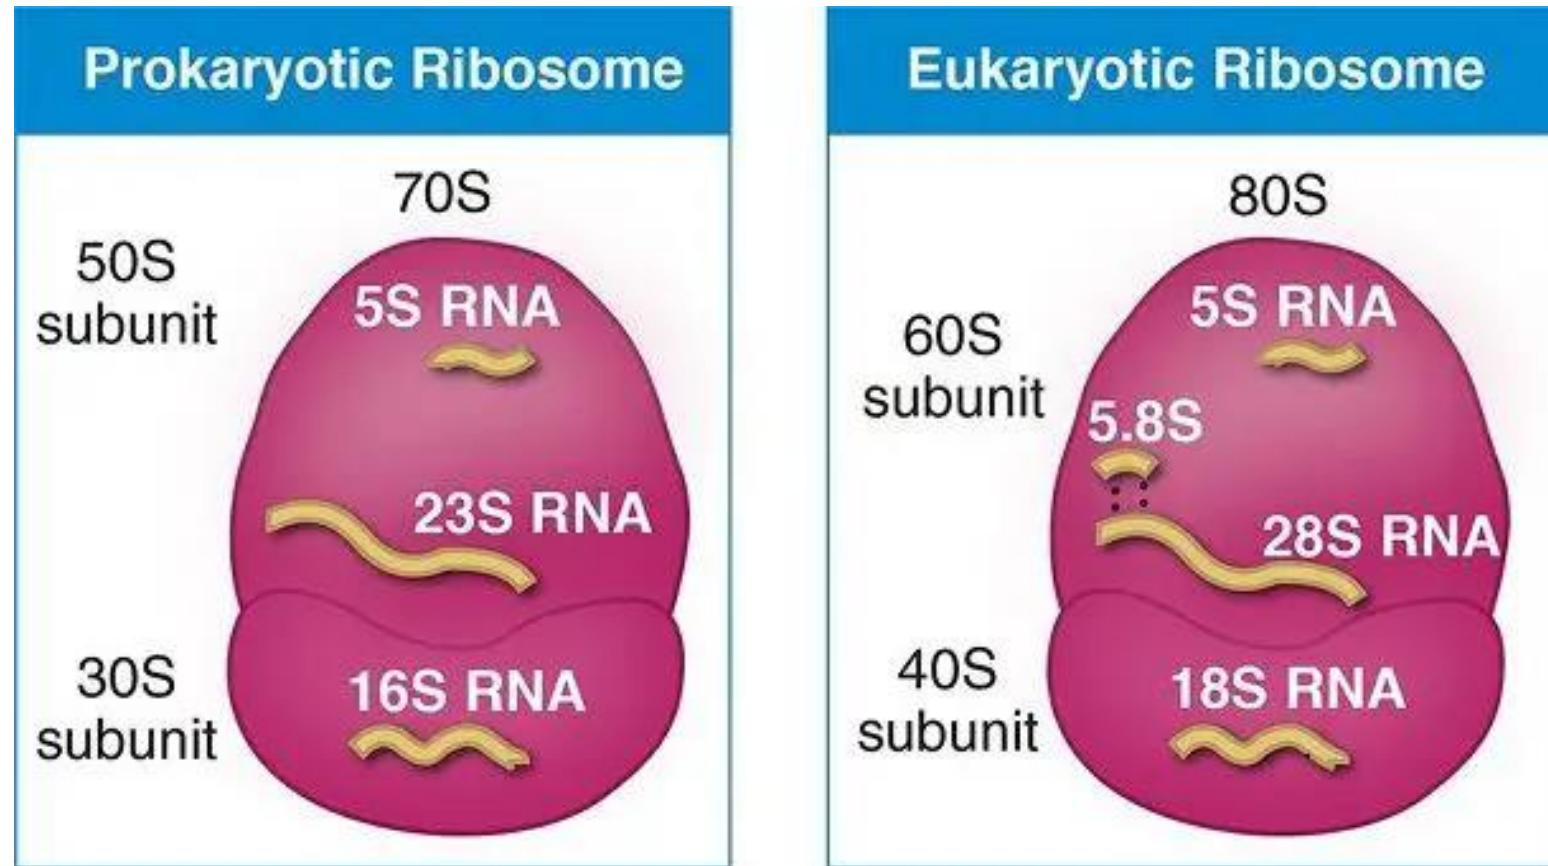

Example: Marker genes like 16S can be found in all organisms or like 18S in eukaryotic cells

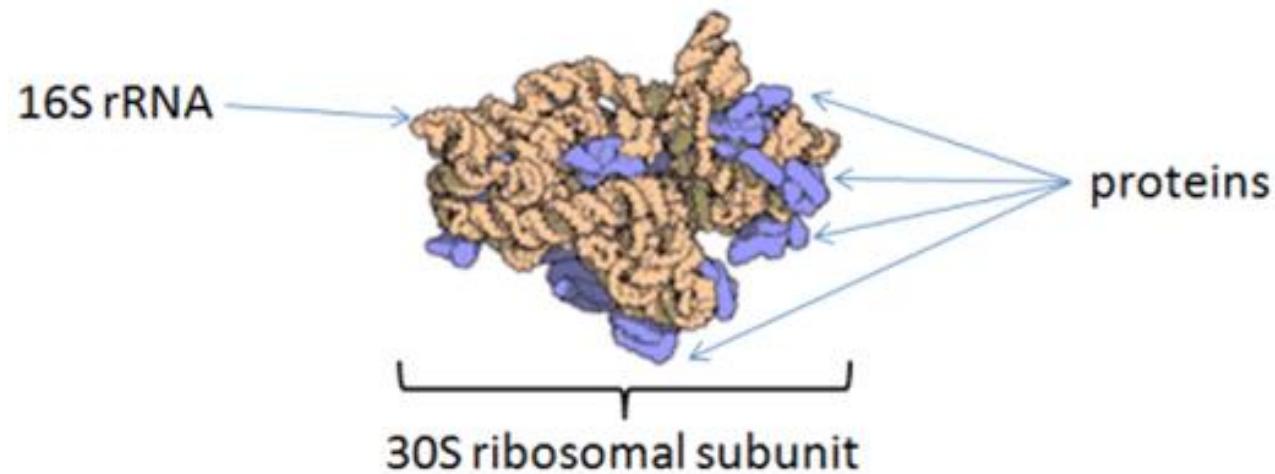

# Barcode

16S rRNA gene is coding for 16S rRNA not for proteins!

## Barcode

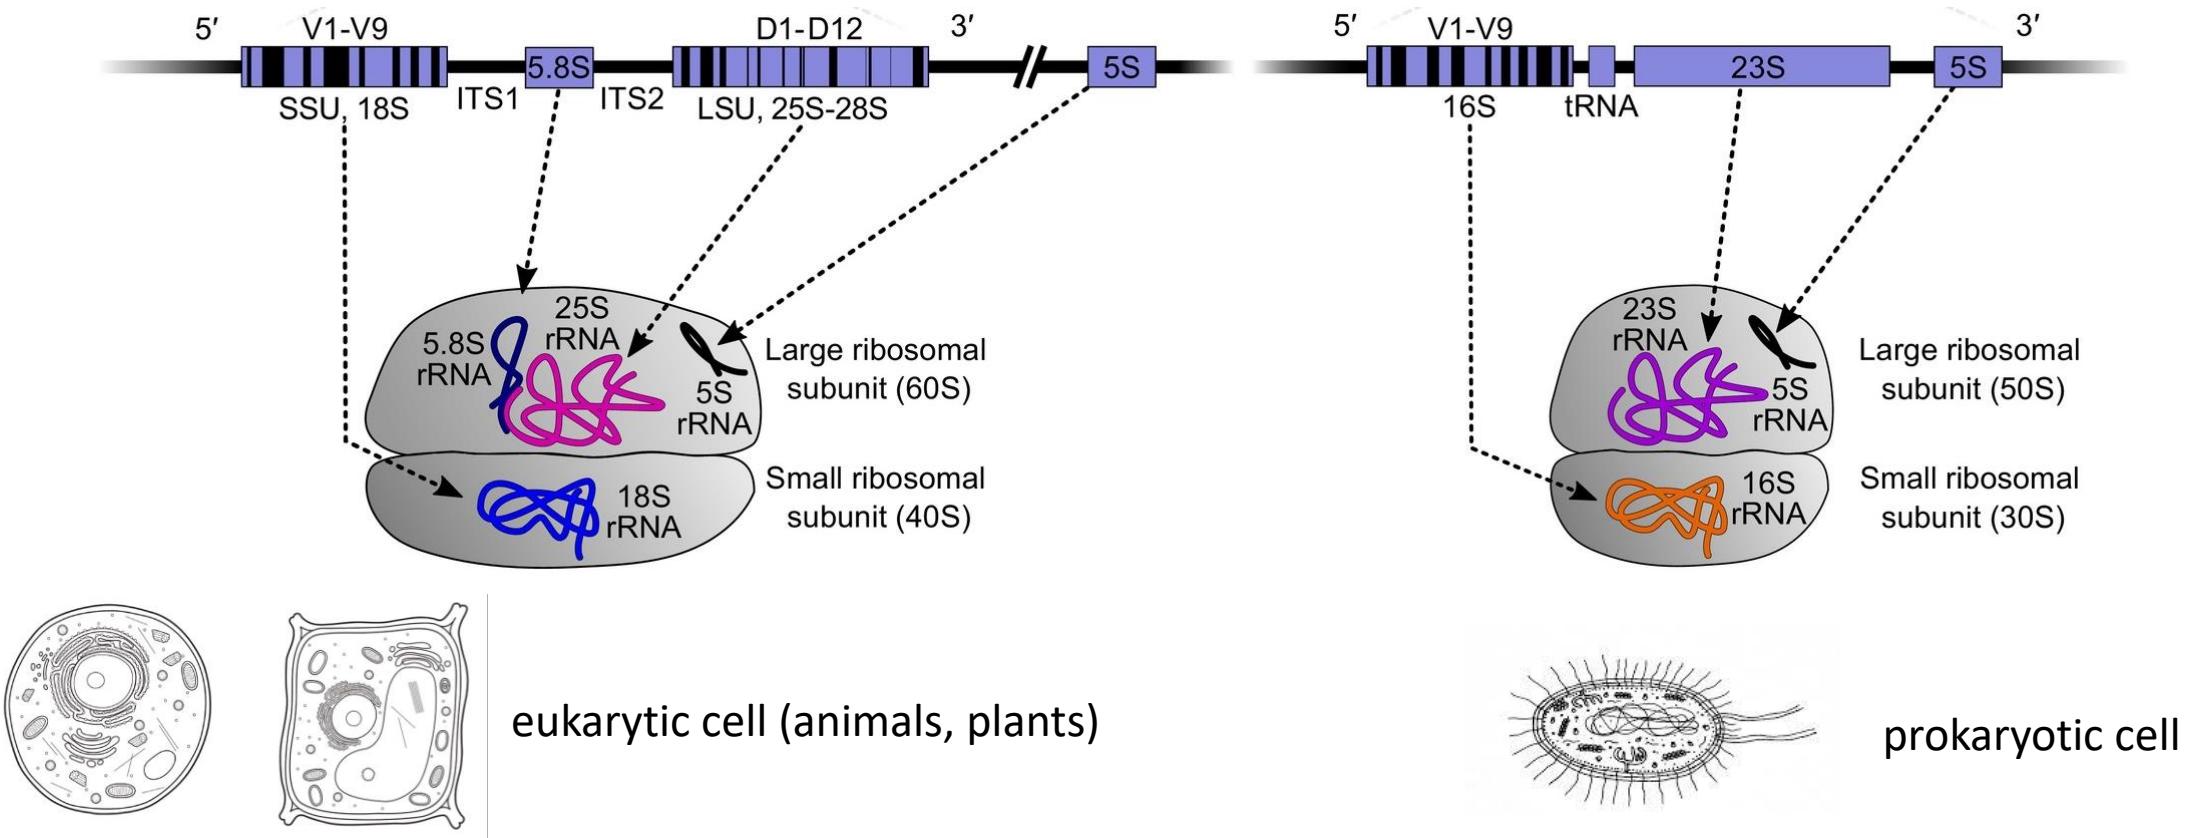

**A.****B.**

16SrRNA gene

— = Conserved region  
..... = Variable region

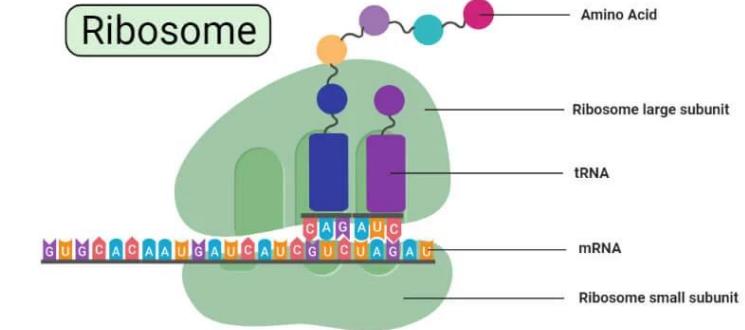

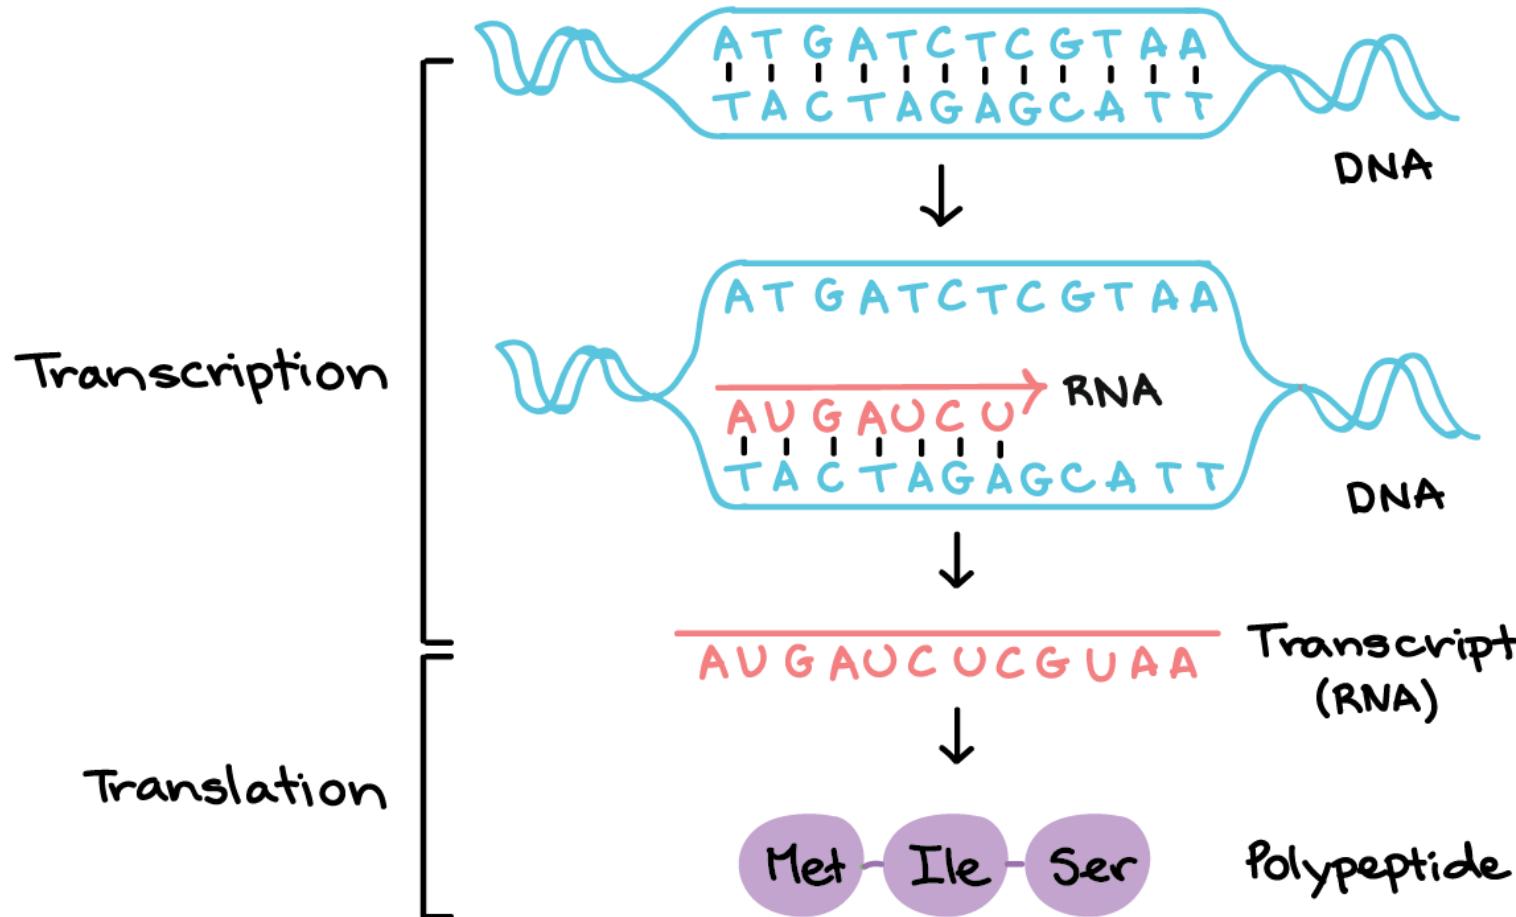

# Barcode

Ribosomal genes  
- organized in an operon

# Barcode

DNA is important in several processes

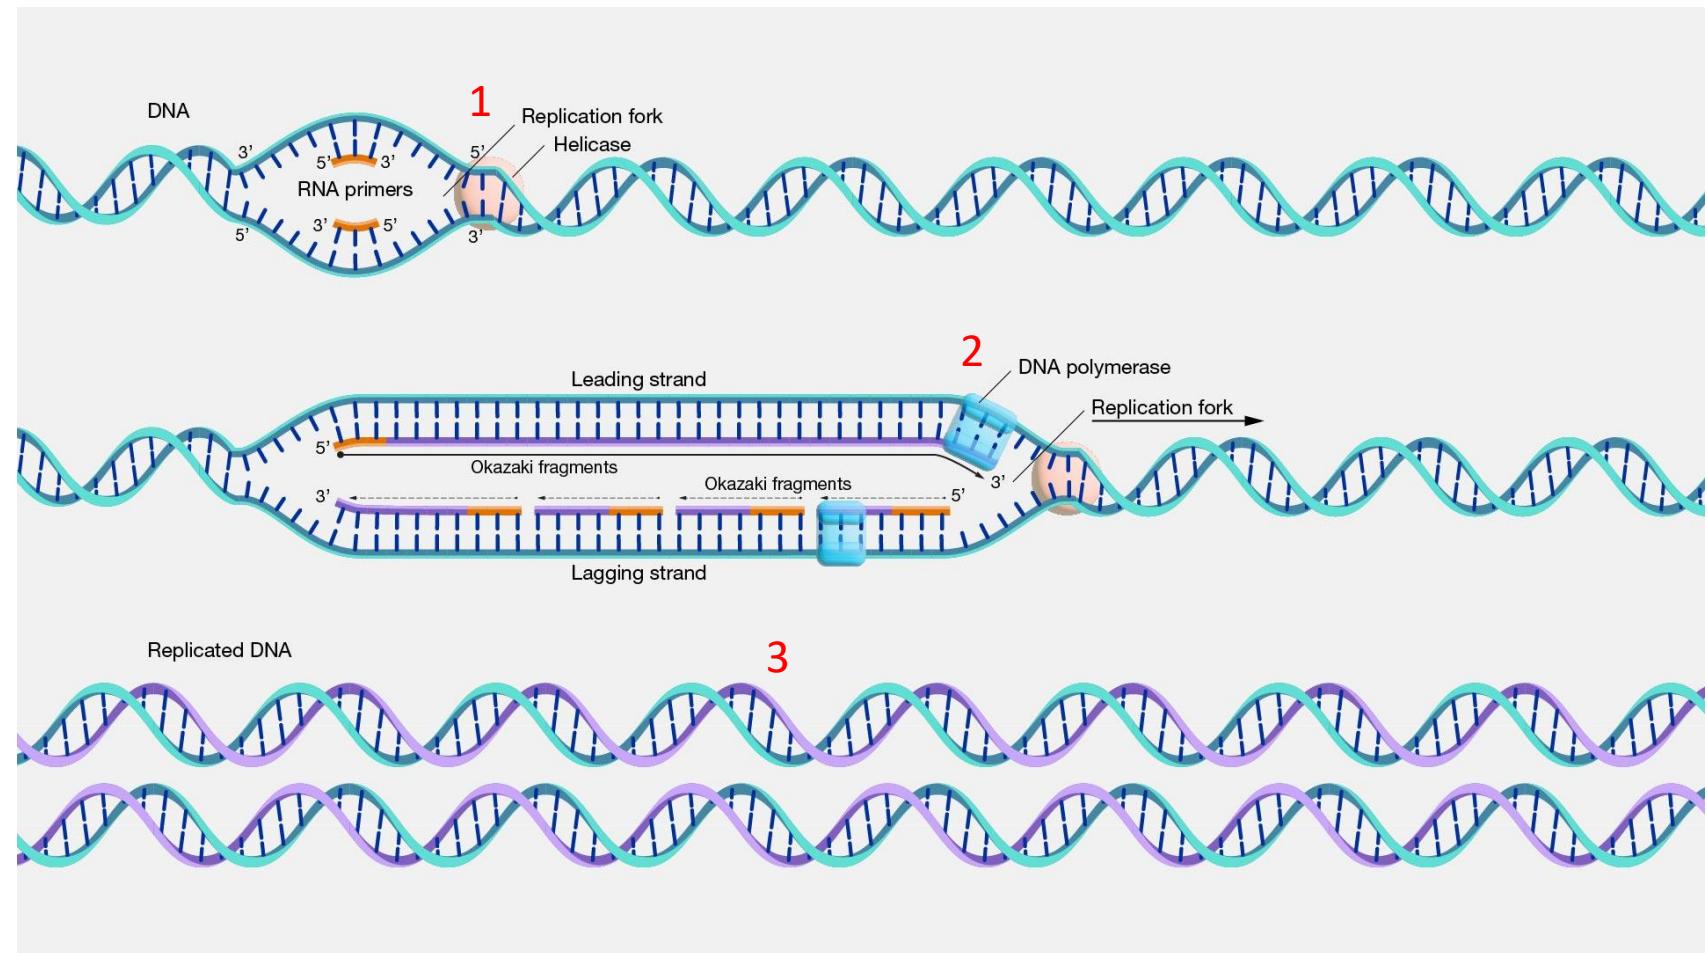

# Barcode

DNA replication

1 initiation

2 elongation

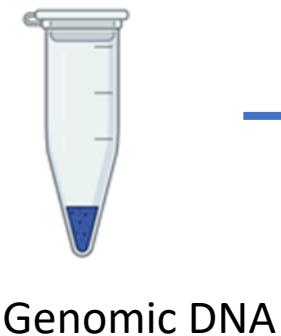

3 termination

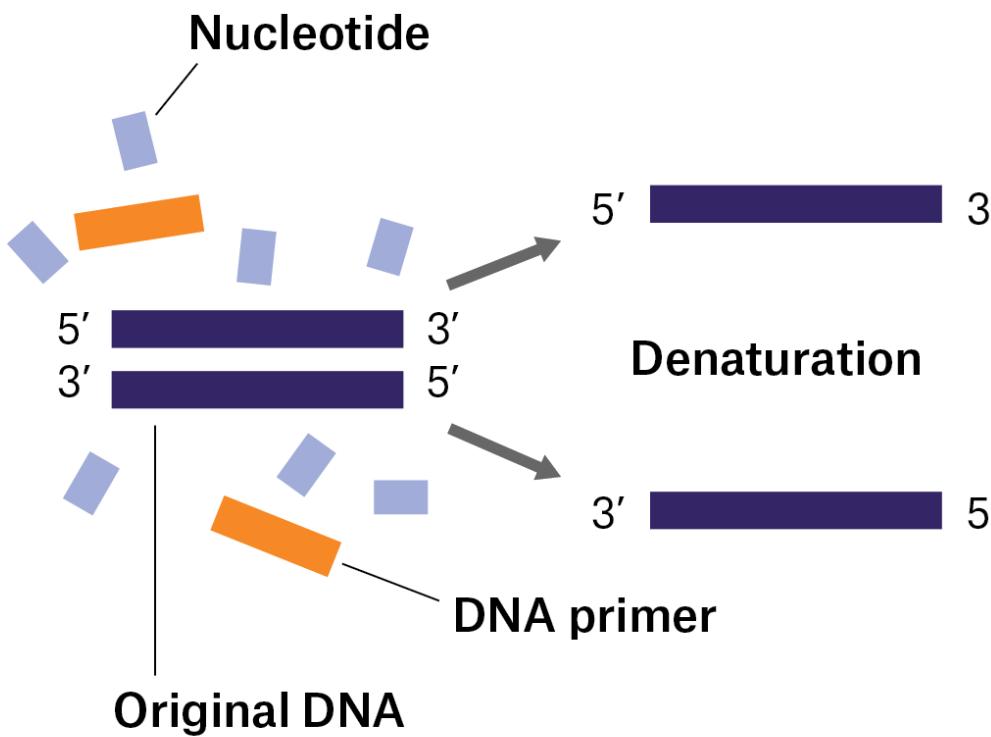

- DNA replication takes place in the cytoplasm in prokaryotes and in the nucleus in eukaryotes.
- a natural process, at body temperature

## Barcode

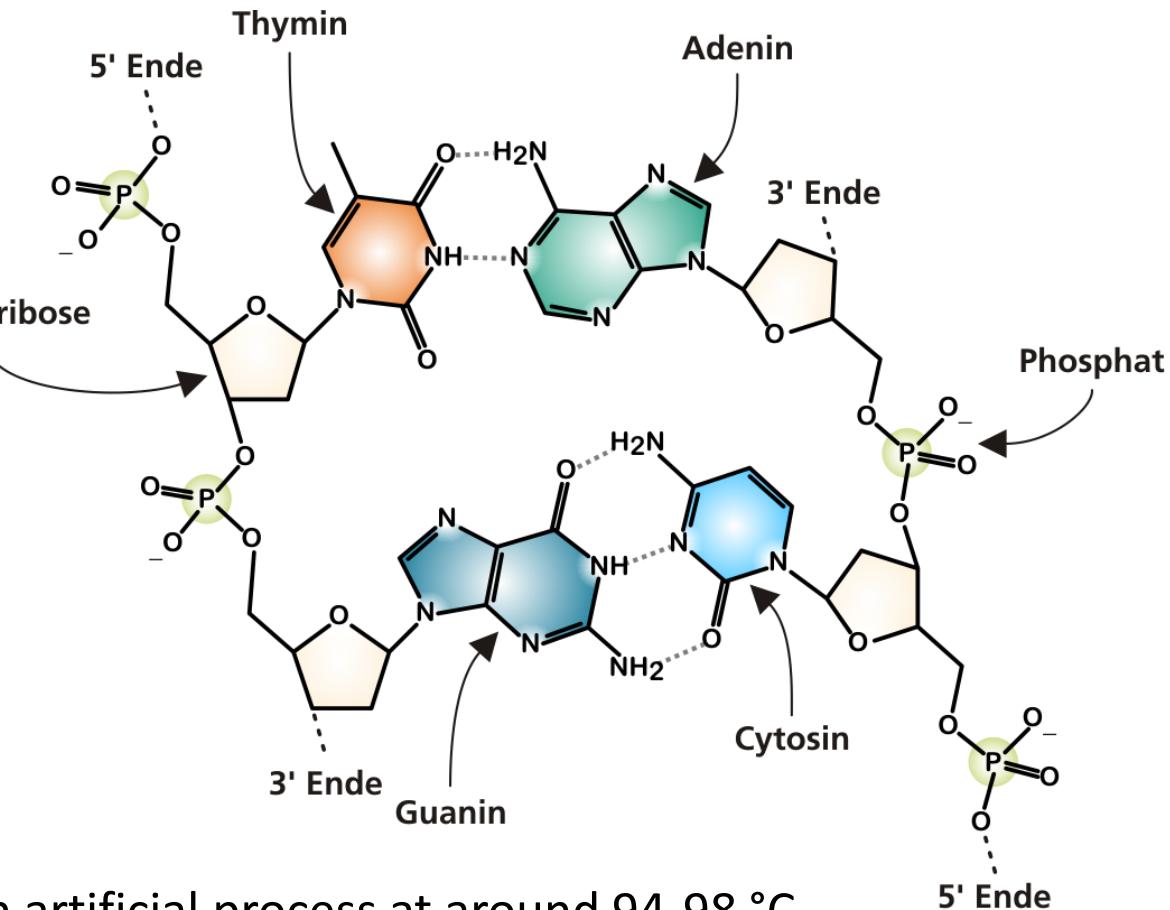

PCR = Polymerase chain reaction  
A method to multiply DNA

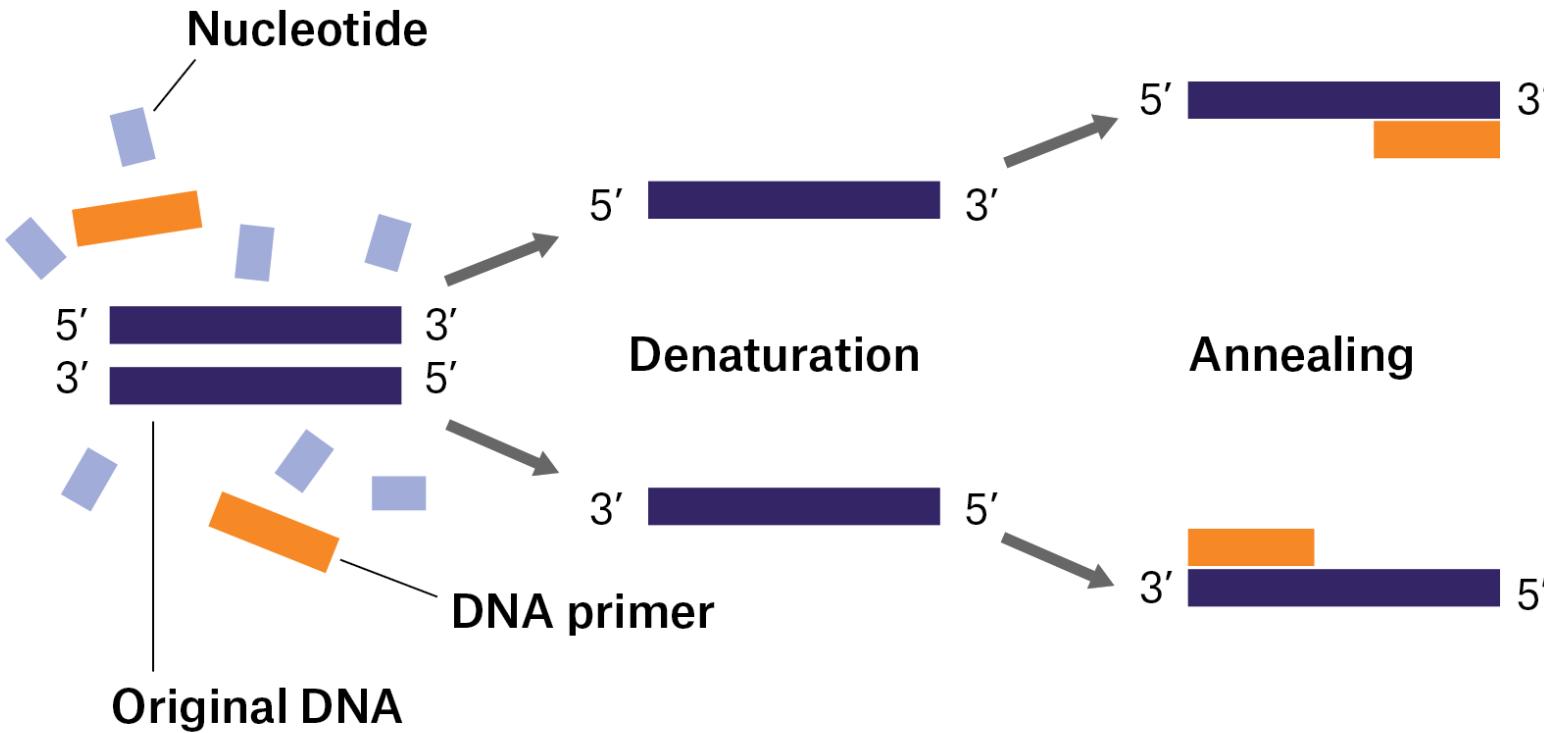

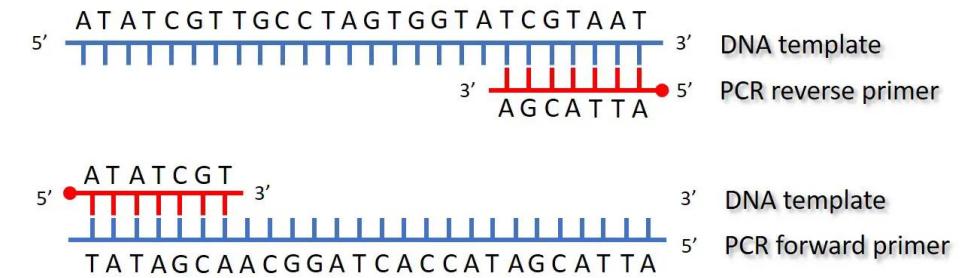

# Barcode*ing*

Denaturation: an artificial process at around 94-98 °C

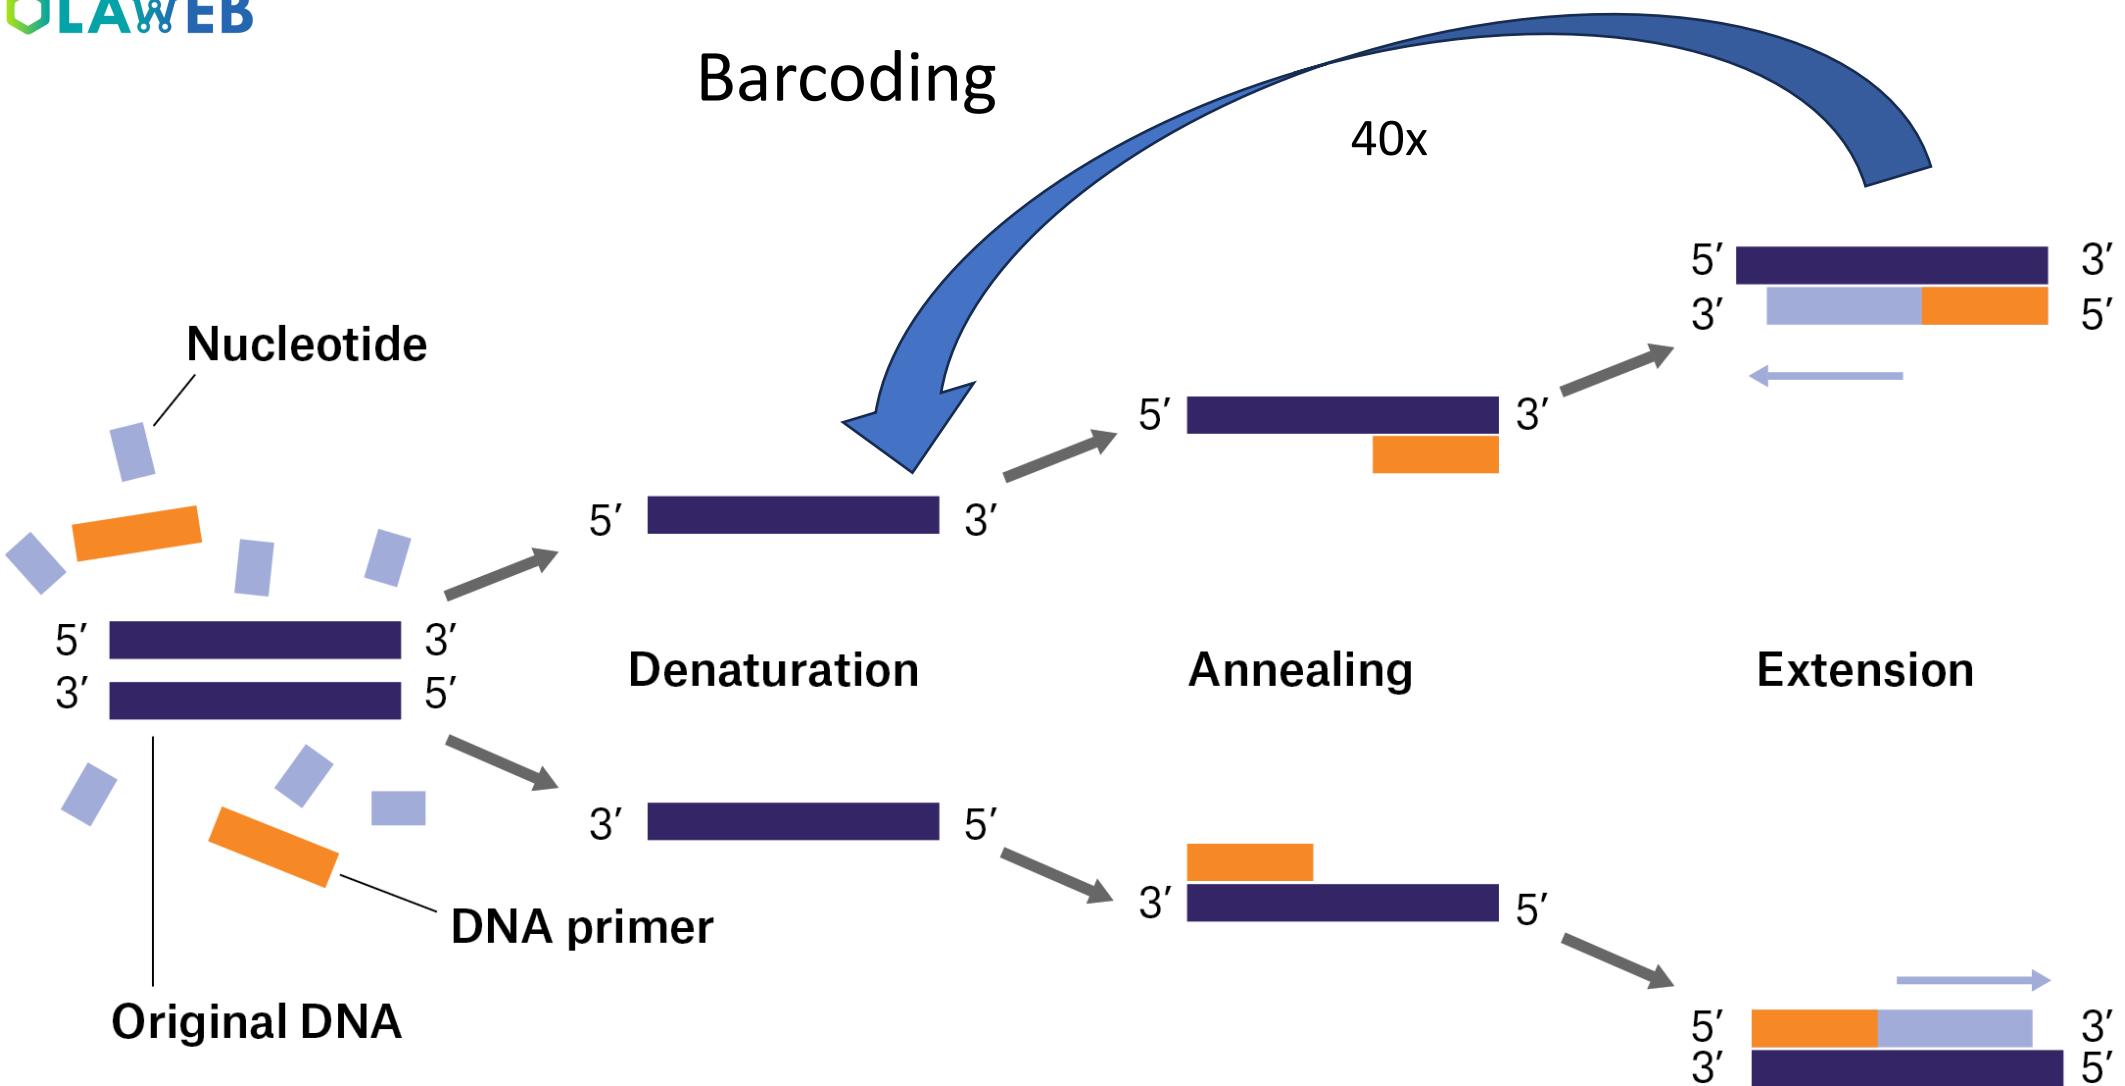

# Barcode

Primer annealing: an artificial process at around 45-62 °C

## Barcoding

Extension: an artificial process at around 70-72 °C  
 Needs: Enzyme DNA polymerase + nucleotides

# Barcoding/Metabarcoding

Must match the PCR technology

Up to 3.4 kb is possible

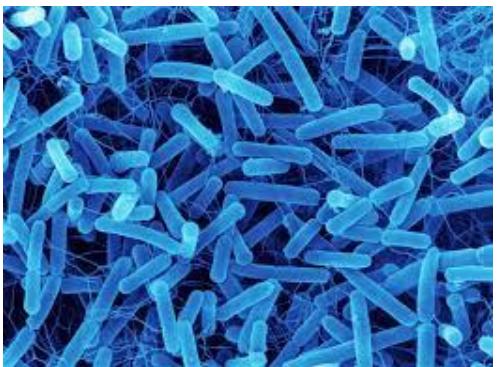

Often 200 -1000 b

PCR machine

The perfect barcode does not exist to target diverse organism groups

# Barcode selection

## How do you select?

From other studies (publications)

- tested
- known bias
- check them against Ref. libraries

May be they are not suitable to your study

Group of organisms	Marker gene/locus used for barcoding
Animals	COI, <i>Cytb</i> , 12S, 16S
Plants	<i>matK</i> , <i>rbcL</i> , <i>psbA-trnH</i> , ITS
Bacteria	COI, <i>rpoB</i> , 16S, <i>cpn60</i> , <i>tuf</i> , RIF, <i>gnd</i>
Fungi	ITS, TEF1 $\alpha$ , RPB1 (LSU), RPB2 (LSU), 18S (SSU)
Protists	ITS, COI, <i>rbcL</i> , 18S, 28S

[https://en.wikipedia.org/wiki/DNA\\_barcoding#cite\\_note-88](https://en.wikipedia.org/wiki/DNA_barcoding#cite_note-88).

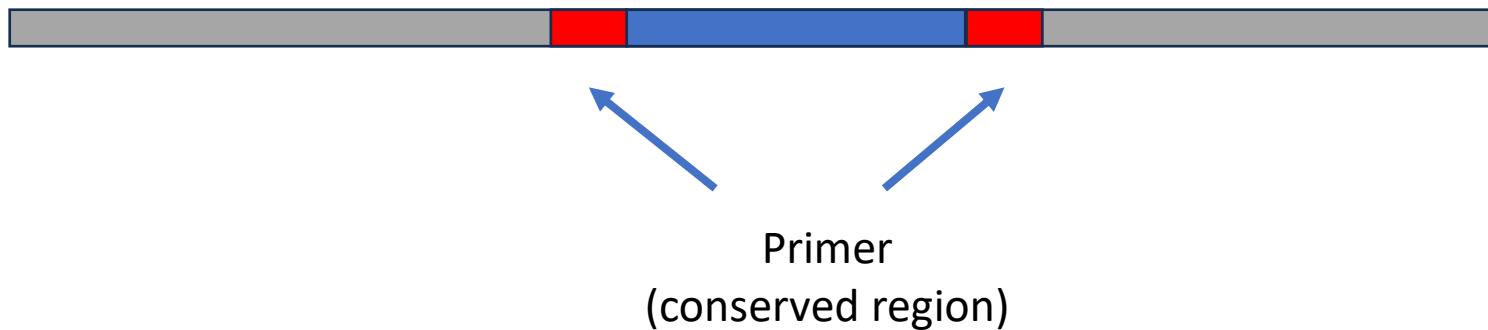

## Design your own primer

- using reference sequences closest to your unknown organism
- needs optimization and time

## Barcode selection: Primer

To target a group of organisms

marker gene  
= barcode  
(variable region)

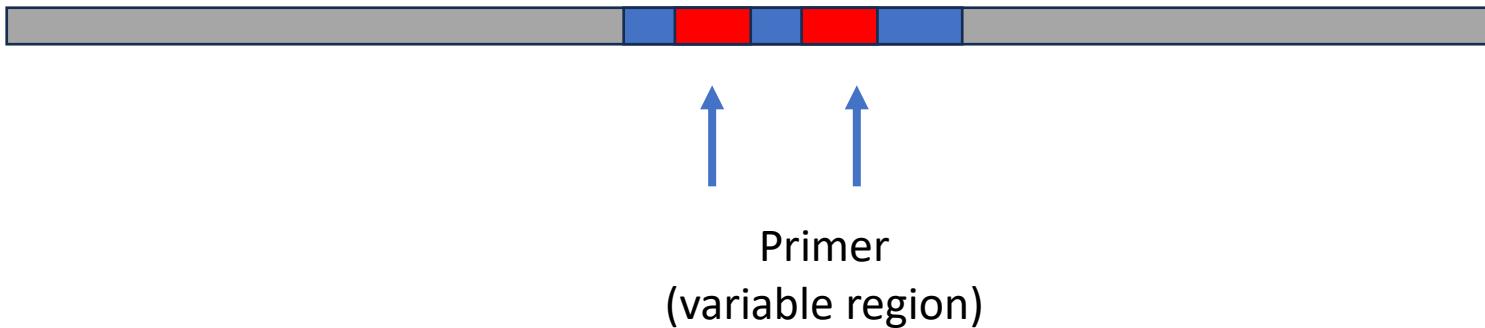

- (i) significant interspecific genetic variability
- (ii) conserved flanking sites for developing universal PCR primers
- (iii) rel. short sequence length depending on sequencing technology

# Barcode selection: Primer

To target a single species

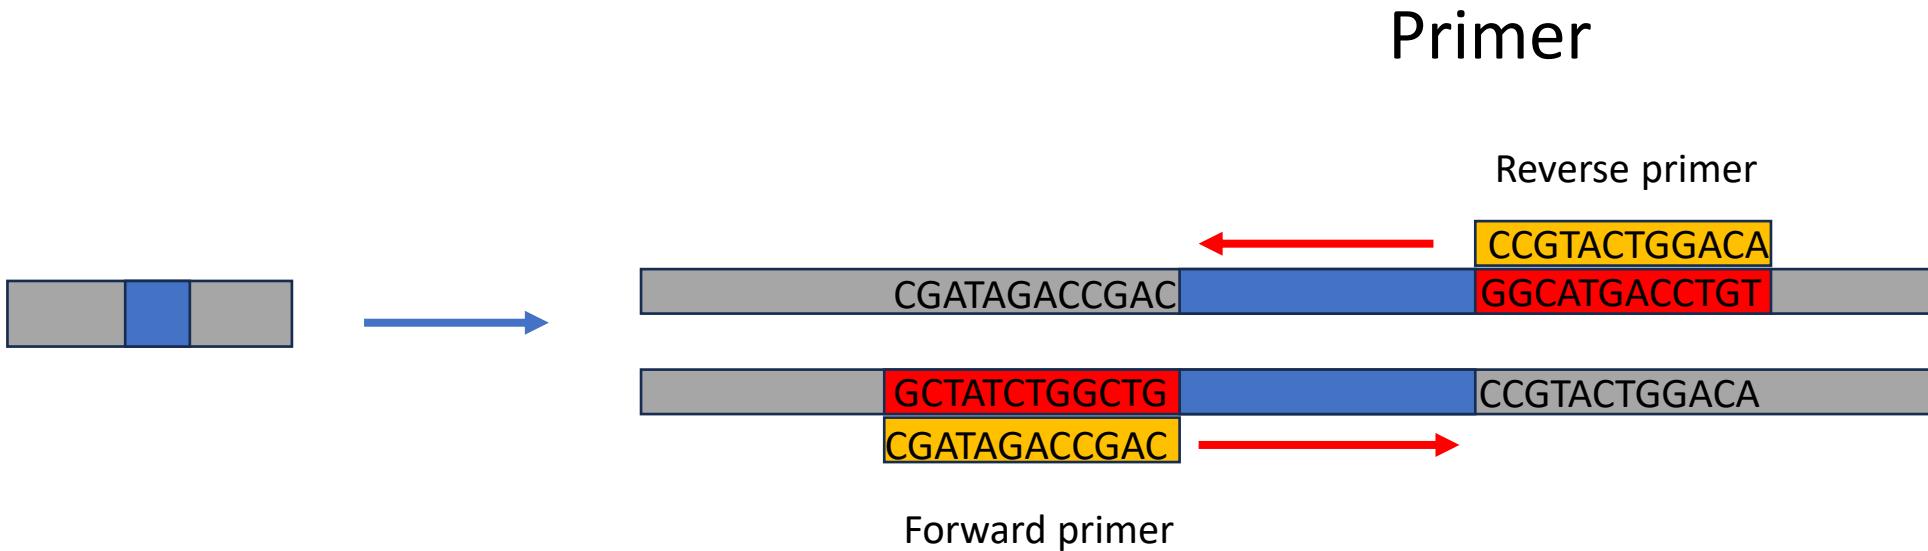

marker gene  
= barcode  
(variable region)

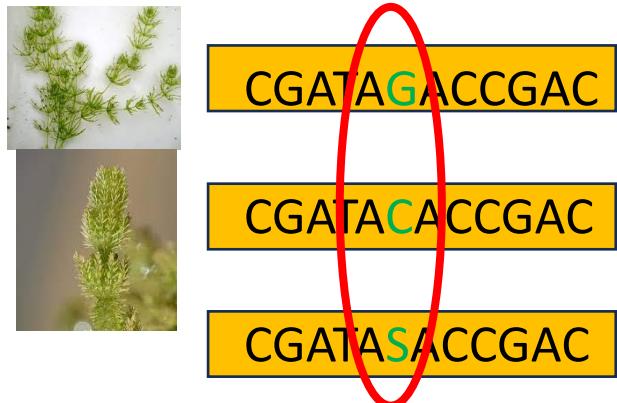

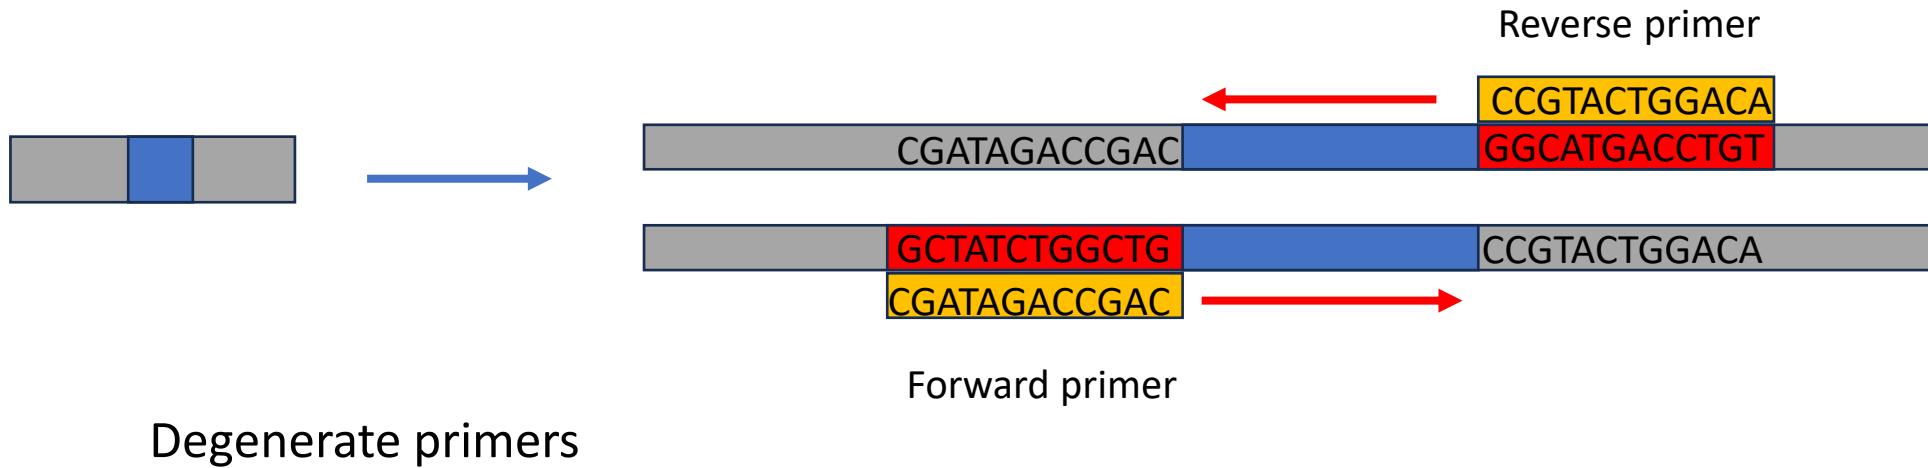

- (i) significant intraspecific genetic variability
- (ii) rel. short sequence length depending on sequencing technology or qPCR

# Barcode selection: Primer

# Barcode selection: Primer

Code	Description
M	AC
R	AG
W	AT
<b>S</b>	<b>CG</b>
Y	CT
K	GT
V	ACG
H	ACT
D	AGT
B	CGT
N	ACGT

# Barcode selection: Primer

How to make your primers?

## PrimerQuest™ Tool

Design primers or assays for PCR, qPCR, or sequencing (any species).

- Customization of ~45 parameters, allowing qPCR assay designs:
  - With specific primer, probe, or amplicon criteria
  - Across a specified location
- Design algorithm includes multiple checks to reduce primer-dimer formation
- Provides flexible sequence entry and batch entries (up to 50 sequences)

## OligoAnalyzer™ Tool

Understand the expected properties of your oligos *before* you order them.

- Calculator for GC content, melting temperature ( $T_m$ ), molecular weight, extinction coefficient,  $\mu\text{g}/\text{O}l$ , nmol/OD, and more
- Identify secondary structure potential
- Minimize dimerization
- Use NCBI BLAST™

# Self-Dimer

4 bp, delta G = -6.6 kc/m (**bad!**) (worst= -36.6)

5' GGGAATTCCGGATCTAT 3'

A horizontal row of eight red vertical bars, evenly spaced from left to right.

3' TATCTAGGA**C**CTT**A**AGGG 5'

# Barcoding/Metabarcoding: Chara spp.

- For several Characean taxa in Serbia metabarcoding is expected to work fine
- for some Characean taxa (*Chara contraria*) new markers have to be found

→

<i>Chara virgata</i>	Sava lake
<i>Chara contraria</i>	Sava lake
<i>Chara globularis</i>	Sava lake
<i>Chara connivens</i>	Sava lake
<i>Chara canescens</i>	Pečena Slatina; Plava banja
<i>Chara vulgaris</i>	Markovačko Lake

Macrophyte (Characeae) barcoding/metabarcoding

### First generation

Sanger sequencing  
Maxam and Gilbert  
Sanger chain termination

Infer nucleotide identity using dNTPs,  
then visualize with electrophoresis

500–1,000 bp fragments

short DNA fragments

Reference library Characeae (matK, rbcL, ITS)

BOLD = Barcode of Life Database

### Third generation

PacBio  
Oxford Nanopore

Sequence native DNA in real time  
with single-molecule resolution

Tens of kb fragments, on average

short to ultra long DNA or RNA fragments

## Take home message

DNA related methods are cheaper and faster in the long run

However, a cooperation between taxonomists and molecular biologist is also a must in the future even with a good reference library

If not the risk of misinterpretations of data is high
